

## Tech Assessment

Please complete the following code test, screenshot your results, or you can post to GitHub or anything like that and include the link.

For this test, it should be done in C#.

### Coding Tech Assessment:

Write a method that takes a string argument and returns whether or not characters in the string have matching angle brackets. Meaning for every < there is a corresponding > bracket. Return true if they do, return false if they do not.

Please unit test with the following use cases (and any others you choose to ensure functionality):

Test string - Expected result

<> - True

>< - False (closed bracket can't proceed all open brackets.)

<<> - False (one bracket pair was not closed)

"" - True. (no brackets in the string will return True)

<abc...xyz> - True (non-bracket characters are ignored appropriately)
